PhyloTrace

Decentralised pathogen surveillance — under your control.

Connect genomic information with epidemiological data to monitor, investigate and look back — in healthcare, food and environment.

Open source
Free software under GPLv3

No coding
One graphical, all-in-one platform

Runs locally
You decide what leaves your lab

Comparable
Across labs, without a central server

For research use only.

LIORA BIOINFORMATICS

WHY PHYLOTRACE

Genomes and epidemiology in one platform.

Genomic surveillance is most powerful when genomes meet their epidemiological context. PhyloTrace is an open-source platform for pathogen surveillance and monitoring that integrates genomic information with epidemiological metadata, on your own hardware and without writing code. For research use only, it supports public health and reference laboratories, food, veterinary and environmental laboratories, and research groups in hospital microbiology and infection prevention.

7.7 M
deaths associated with 33 common bacterial pathogens in 2019[1]

1.27 M
deaths attributable to bacterial antimicrobial resistance in 2019[2]

600 M
people fall ill after eating contaminated food each year[3]

1 **Genomes and epidemiology together**
Typing, resistance findings and your own metadata, analysed side by side.

2 **Ongoing and retrospective**
Monitor continuously as isolates arrive, or analyse existing collections retrospectively at any time.

3 **Comparable without a central server**
Allele fingerprints give partner laboratories identical results without coordinating.

4 **Verifiable and under your control**
Every result keeps its provenance — assembly fingerprint, scheme version, thresholds, tool versions — and you choose what leaves your lab.

Watch what is emerging. Revisit what happened. In every setting.

Public health
Recognise unexpected clusters early · revisit past events

Food-associated
Watch for recurring strains · trace back a contamination

Environmental
Track reservoirs over time · test a suspected source

INSIDE THE PLATFORM

Everything in one place.

Set up	Type & screen	Curate	Analyse	Share
One portable file				

Typing & resistance

cgMLST and MLST typing alongside NCBI AMRFinderPlus resistance screening in one run — so resistance is part of every analysis.

Overviews & quality control

Overviews of provenance, assembly quality, schemes, profile completeness and typing settings, plus consistency and duplicate checks — so you know what your collection holds and weak data never distorts clusters.

Trees, curves, maps, heatmaps

Relatedness, time, place and resistance in one view — so you see when and where transmission happened.

Your metadata, your variables

Dates, sources, sites and any variable you define, mapped onto every view — so relatedness is always read in its epidemiological context.

Collaborate without centralising.

Same allele, same name
Partners get identical identifiers without a central server.

You decide what travels
Share any subset, field by field; sensitive data stays in your lab.

No hub to depend on
Each lab keeps analysing when a partner or service is down.

Free to use. Supported when you need it.

Community
Free software, public updates, public documentation and community support

Subscription
Direct support, priority and earlier access to updates, onboarding and professional documentation · **€149/month**[1]

1 Download
Free from GitHub

2 Demo
For your use case

3 Pilot
6 months

4 Subscription
Routine use

Trust

Designed with data protection in mind: your data stays on your hardware, no customer data at Liora, no telemetry · Open source under GPLv3 · Developed with HFU and MUG · Made in Germany

[1] All prices are net prices in euros, plus statutory VAT; subscription with a minimum term of 12 months. · **For research use only.** Not a medical device.

PhyloTrace

Ready to bring pathogen surveillance into your lab?

See PhyloTrace with your own questions in mind. We'll show you how it fits your laboratory or network.
